PROJECT 2ND : Fake Job Title Generator

The Fake Job Title Generator randomly combines adjectives and job roles to create hilarious and absurd job titles like "Quantum Marketing Ninja" or "Digital Synergy Officer." This Java project teaches interns about randomization, arrays, and string concatenation in a fun and creative way.

Small Step-by-Step Guide:

Step 1: Create two arrays: one for adjectives and one for job titles.

Step 2: Use Java's Random class to select a random index from each array.

Step 3: Combine the two words into a title using string concatenation.

Step 4: Display the generated title to the user.

Step 5: Ask if they want to generate another one using a loop.

Concepts Used in This Project:

- Arrays
- Random number generation (Random.nextInt())
- Loops (for replay option)
- String concatenation and formatting

Why We Have Chosen This Project:

- It sparks creativity and is very beginner-friendly.
- Helps interns learn random selection and array manipulation.
- Fun to share, making it great for learning and engagement with peers or on social media.
